

Bring work into Microsoft Teams with Looply

Looply connects your enterprise processes to Microsoft Teams, ending email chaos, speeding up decisions, and putting you back in control.

Managers today have too many apps, portals and inboxes, so rely on email notifications for many enterprise processes. This causes risk in work getting lost or delayed.

Looply fixes this by bringing notifications and approval tasks straight into Microsoft Teams, where they already work.

Workflow tasks reach managers in real time, and can be processed more easily and quickly than ever before, without leaving Teams.

This means that processes **move faster**, people are **more productive**, and the risk of lost or delayed work is **enormously reduced**.

Use Looply to transform processes across the enterprise:

Purchasing

Simplify purchasing processes, bringing notifications and approvals into Microsoft Teams

Master Data Management

Digitise MDM processes, replacing emails with Teams cards, using SAP Fiori, SAP MDG or SimpleMDG.

Finance

Enhance, automate and simplify financial processes for data collection, validation, approvals and output.

Process Orchestration

Automate manual processes and integrate with multiple systems, transforming each user touch-point.

Human Capital Management

Enhance HCM processes to improve user experience, data integrity and employee correspondence.

Communication

Simplify your communication channels, ensuring email is used for external communication only.

User Experience

Looply uses Microsoft Adaptive Cards for the user interface, within Teams Chat. This keeps the user in a Microsoft environment instead of switching between UIs.

Purchase Requisition Approval

INITIAL

Requestor	Franz Musterman
Date	02/20/2025
Purchase Requisition	10001516
Description	unom3
Total Cost	\$ 1,700.00

Please can we order these by the end of February

Material	Qty	Cost
Pump PRECISION 101 32	2 PC	\$ 800.00
Pump PRECISION 103 34	2 PC	\$ 900.00

Looply is a cloud platform, residing on AWS.
It is triggered via APIs, and integrates with enterprise systems via their APIs.

We support three deployment models:

1. Looply Public Cloud - Multi-Tenant SaaS

Your organization is provisioned as a logically isolated tenant within our managed multi-tenant environment, hosted on AWS in the EU (Ireland) region.

Looply handles everything: provisioning, updates, scaling, backups, and security. All infrastructure is fully managed.

2. Looply Private Cloud - Looply Managed

Looply creates and manages a dedicated AWS sub-account on your behalf. The environment is exclusively yours but operated and monitored by Looply.

This gives you many of the benefits of private cloud with none of the infrastructure maintenance burden.

3. Customer-Owned Private Cloud - Looply Managed

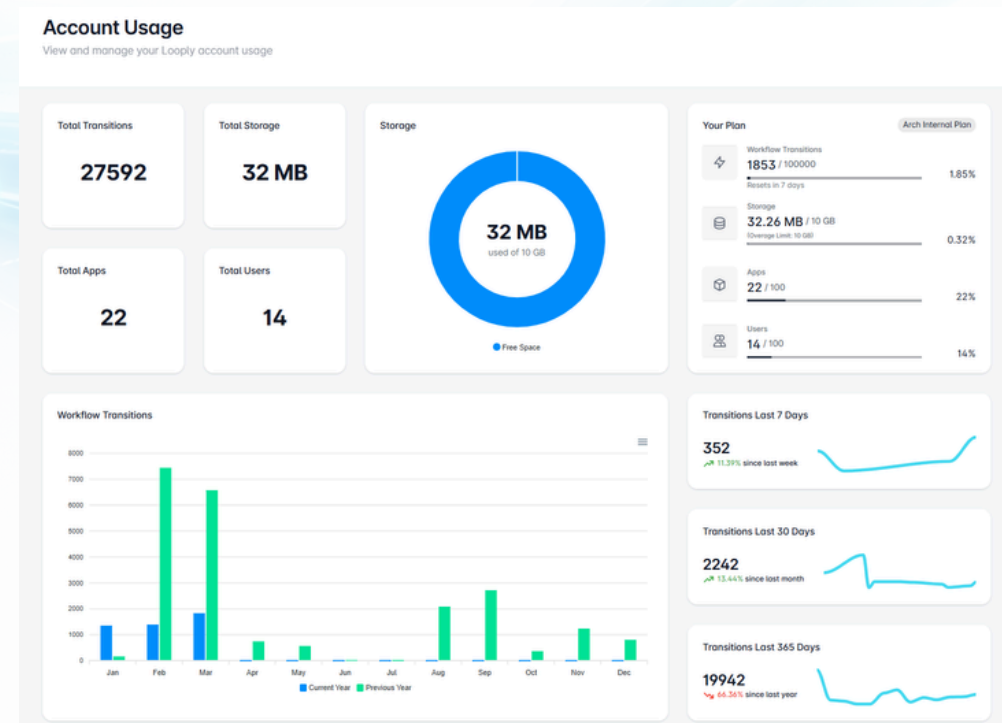

Looply can be deployed directly into your AWS account. In this model, Looply provides you with infrastructure templates and deployment tooling to provision and manage the environment within your own cloud footprint.

SAP Certified

for clean core with SAP S/4HANA Cloud

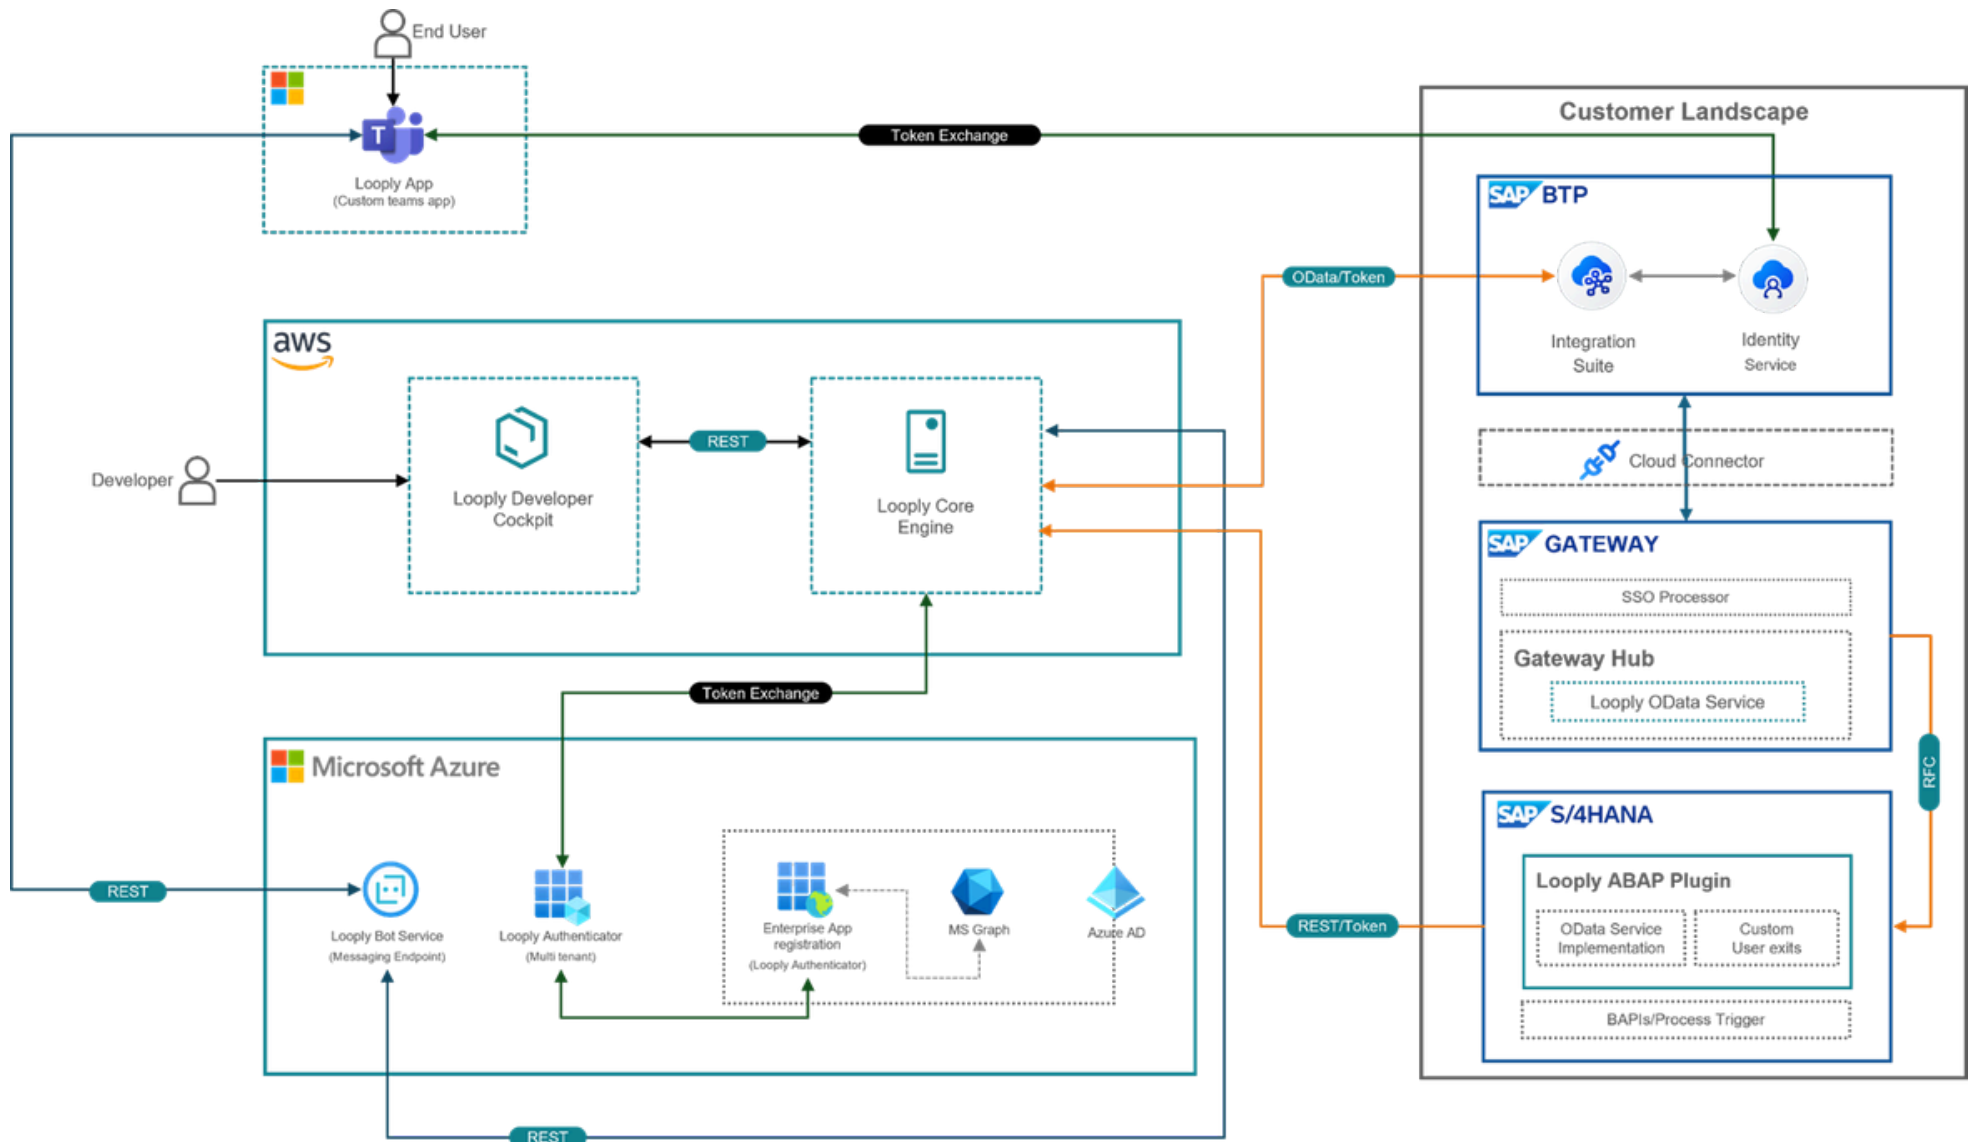

A SAP-certified Add-on is provided to make integration with SAP systems easier.

This provides methods to trigger the Looply APIs and configuration tables to store process controls for data selection or system updates: It reduces the development and maintenance effort.

Account usage reporting in Looply

Looply integration with SAP systems: Typical architecture

*Looply makes use of Microsoft Azure services, but no set up is needed in Azure.
Simply configure connections to your Teams environment and SAP landscape within Looply.*
